

# PIPELINE MANIFOLD

## PIPELINE MANIFOLD WITH FLOW SENSOR AND MOTORIZED EV

The pipeline manifold is a hydraulic circuit placed on a panel that standardizes the installation in order to reduce learning, execution and related errors. Therefore, it simplifies and improves the quality of the system to be implemented with a clear reduction in installation costs, due to the individual on-site design with the consequent search for the materials to be used.

Furthermore, the standardized installation homogenises the various systems, facilitating the learning and execution of maintenance.

- › Motorized valve
- › Ball valve water inlet
- › Ball valve water outlet
- › No-return valve
- › Flow sensor
- › 3 injection points
- › Cross connection for conductivity and pH probe (Redox on request)
